```
The present sequence is given in a specification relating to an isolated nucleic acid molecule encoding a platelet membrane glycoprotein receptor glycoprotein VI (GPVI), also called TAMGO 268. The GPVI polymucleotides and polypeptides and their modulators, e.g. antisense nucleic acids, ribozymes and antibodies, are useful for preventing, treating and diagnosing disorders associated with aberrant expression or activity of GPVI. These disorders include bleeding disorders (e.g. thrombocytopaenia), blood vessel injury, thrombotic disorders (e.g. thrombocytopaenia), blood vessel injury, thrombotic disorders (e.g. coronary artery and cerebral artery diseases (e.g. stroke and ischaemia), cardiovascular diseases (e.g. atherosclerosis and myocardial infarction), mimunological diseases (e.g. platelet disorder) and empryonic liver disorders. Preferrably they are used to prevent acture cardiac ischaemia following angioplasty and metastatic cancers, especially of the colon and

This invention relates to a novel purified antibody comprising a variable heavy (VH) complementarity determining region (CDR)1, VH CDR2 or VH CDR3; CC or variable light (VI) CDR1, VI CDR2 or VI CDR3, and immunospecifically complementarity determining region (CDR3); VH CDR2 or VI CDR3; CC binding to a TANGO 268 (also referred as glycoprotein VI (GPVI)) antigen. CC The antibodies of the invention act to decrease or block TANGO 268 (also referred as a collagen or platelet calease and aggregation blocker. The antibodies of the invention are release and aggregation blocker. The antibodies of the invention are useful for modulating proliferation, migration, morphology, differentiation and/or function of megakaryocytes and platelet engenchelium interactions in inflammation and/or thrombosis, and modulating platelet aggregation and degranulation. They are also useful for modulating disorders associated with abnormal or aberrant megakaryocyte and/or platelet proliferation, migration, caberrant megakaryocyte and/or platelet proliferation, migration, and sorders such as thrombocytopaenia. Other diseases which may be modulated by these are thrombocic disorders, cerebral vascular diseases (e.g. articke and ischaemia) venous thromboembolism diseases (e.g. diseases (e.g. cardiovascular diseases (e.g. diseases (e.g. coronary diseases (e.g. cardiovascular diseases including angina coronary diseases (e.g. cardiovascular diseases venous ceto); immunological disorders, cerebral vascular diseases, venous thromboembolism diseases, and medastatic cancers. The

antibodies of the invention only causes a transient decrease in platelet counts, platelet aggregation, and/or platelet activation and so have some advantages over prior art methods. The present sequence represents a peptide sequence used to generate the antibodies of the invention

The present sequence is given in a specification relating to an isolated nucleic acid molecule encoding a platelet membrane glycoprotein receptor glycoprotein VI (GPVI), also called TANGO 268. The GPVI polymucleotides and their modulators, e.g. antisense nucleic acids, and their modulators, e.g. antisense nucleic acids, ribozymes and antibodies, are useful for preventing, treating and diagnosing disorders associated with aberrant expression or activity of GPVI. These disorders include bleeding disorders (e.g. thrombocytopaenia), blood vessel injury, thrombotic disorders, coronary artery and cerebral artery diseases (e.g. stroke and ischaemia), coronary artery and cerebral artery diseases (e.g. stroke and ischaemia), candiovascular diseases (e.g. atheroselerosis and myocardial infarction), immunological diseases (e.g. platelet disorder) and embryonic liver disorders. Preferably they are used to prevent acture cardiac ischaemia following angioplasty and metastatic cancers, especially of the colon and

```
This invention relates to a novel purified antibody comprising a variable heavy (VH) complementarity determining region (CDR)1, VH CDR2 or VH CDR3; C reavy (VH) complementarity determining region (CDR)1, VH CDR2 or VH CDR3; and immunospecifically constrained by the complementarity of CDR2 or VI CDR3, and immunospecifically constrained to a TANGO 268 (also referred as glycoprotein VI (GPVI)) antigen. The antibodies of the invention act to decrease or block TANGO 268 (also referred as a collagen or platelet related to expect the antibodies of the invention are useful for modulating proliferation, migration, morphology, differentiation and/or function of megakaryocytes and platelet.

CC differentiation and/or function of megakaryocytes and platelet of control of megakaryocytes and platelet agreedation and degranulation. They are also useful for modulating disorders associated with abnormal or aberrant megakaryocyte and/or platelet proliferation, migration, a dabrrant and absorbed and/or platelet proliferation, migration, morphology, differentiation and/or function, e.g. bleeding disorders such

Producing a folded extramembranous receptor domain of a membrane receptor under chemoselective chemical ligation conditions, useful as a vaccine for treating various diseases, e.g. metabolic disease, nervous system disorders and cancer,

Example 1; Page 30; 56pp; English.

AAB19612) of glucagon-like peptide I receptor in an example of the method of the invention. This relates to the chemical synthesis of extramembranous receptor domains (ERDS), such as the soluble ligandbinding extracellular and cytosolic Genains, of membrane protein receptors. The ERDs are produced by ligating, under chemoselective ligation conditions, first and second peptides of an ERD of a membrane protein receptor, where the peptides have unprotected chemoselective reactive groups capable of forming a covalent bond. The ligation product is exposed to a folding buffer having a chaotropic reagent and an organic Chemically synthesised peptide 2 is 1 of 3 peptides (see also AAB19609 and AAB19611) used in the preparation of the N-terminal domain (see

The invention relates to a method of detecting (MI) cancer in a patient by: (i) contacting a biological sample from the patient with an agent that binds to any of three polypeptides given in the specification; (ii) detecting in a sample an amount of the peptide that binds to the binding agent; and (iii) comparing the amount of polypeptide present in the patient's sample to a predetermined cutoff value. The specification also discloses a separate method for detecting (M2) cancer in a patient by a method similar to M1, except that the detection agent is an oligonucleotide that binds to any of three polymucleotides given in the specification. M1 and M2 are useful for detecting the presence of cancer in a patient, especially chronic lymphocytic leukemia. The applicants have identified specific human polypeptides overexpressed in one or more

solvent that approximates the water-lipid interface of a cell membrane. Exposure to the folding buffer is followed by isolation from the buffer of ligation product that binds to a ligand of the membrane protein receptor. The ligand-binding portion of the ligation product represents folded ERD. The invention is exemplified by total chemical synthesis of the N-terminal domain of glucagon-like peptide I receptor, demonstration of its ability to bind to peptide ligand and characterisation of its disulphide map. The method provides access to non-limiting amounts of hits-tranger and ulta-pure and ulta-honogeneous soluble ERDs useful for drug discovery, high-throughput screening of receptor ligands, as therapeutics, e.g. for treatment of metabolic diseases, nervous system diseases and cancer, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting cancer in a patient comprises contacting a biological sample from the patient with a binding agent that binds to a cancer-associated polypeptide and comparing the amount of polypeptide to a predetermined

The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheiner's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, diabetes mellitus type II and many others listed) or susceptibility to these disorders. The method allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; beta-amyloid precursor protein; beta-APP; diagnosis; cancer; frameshift mutation; age-related disease; neurodegenerative disorder; Alzheimer's disease; Down's syndrome; myotonic dystrophy; neuronal; Huntington's disease; multiple sclerosis; alcoholic liver disease; disbetes mellitus type II; microtubule associated protein; Tau; Big Tau; ubiquitin B; apolipoprotein B; MAP2; neurofilament-Li; neurofilament-M; neurofilament-Ti; presenilin I; presenilin II; cellular tumour antigen; glial fibrillary acidic protein; GFAP; p53; semaphorin III; HUPF-I; bcl-2; B-cell leukemia/Lymphoma 2 proto-oncogene; HMGP-C; NSP-A; high mobility group protein-C; neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    for

```
This invention describes a novel method for the diagnosis of a disease caused by, or associated with, an RNA molecule that has a frameshift mutation. The method is used to diagnose age-related diseases, especially cancer and a wide range of neurodegenerative disorders (e.g. Alzheimer's disease, Down's syndrome, myotonic dystrophy, Huntington's disease, multiple sclerosis, alcoholic liver disease, diabetes mellitus type II
                                                                                                                                                                                                                                                    Human; beta-amyloid precursor protein; beta-APP; diagnosis; cancer; frameshift mutation; age-related disease; neurodegenerative disorder; Alzheimer's disease; Down's syndrome; myconic dystrophy; neuronal; Huntington's disease; multiple sclerosis; alcoholic liver disease; diabetes mellitus type II; microtubule associated protein; Tau; Big Tau; ubiquitin B; apolipoprotein E; MAP2; neurofilament-L; neurofilament-K; presenilin I; presenilin II; cellular tumour antigen; glial fibrillary acidic protein; GFAP; p53; semaphorin III; HUPF-I; bcl-2; B-cell leukemia/lymphoma 2 proto-oncogene; HMGP-C; NSP-A; high mobility group protein-C; neuroendocrine specific protein A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnosing disease by detecting frameshift mutations in RNA or corresponding protein mutations - used to diagnose cancer and neurological diseases, particularly Alzheimer's disease, and also treatment and prevention with specific ribozymes or wild-type RNA.
                                                                                                                                                                                                                       Human ubiquitin B mutant protein fragment 8.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Burbach JPH

          allows a definitive diagnosis of Alzheimer's disease in living patients, at an early stage. It is based on the observation that disease may be caused by mutations in RNA rather than DNA. The invention describes the used of neuronal system RNA molecules, specifically proteins including beta-amyloid precursor protein (beta-APP), the microtubule associated proteins Tau and Big Tau, ubiquitin B, apolipoprotein E, microtubule associated protein E (MAP2), neurofilament-L, neurofilament-E, the cellular tumour antigen p53, B-cell leukemia/lymphoma protein (GRAP), the cellular tumour antigen p53, B-cell leukemia/lymphoma protein-C (HMGP-C) and neuroendocrine specific protein A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antibacterial; protozoacide; vaccine; cell-wall material; anchor protein; dram-positive bacterium; Lactococcus lactis; AcmA; biocatalyst; mucosal immunization; bloadsorbent; biofilter; microbiocatalyst; vaccination; malaria; Streptococcus pneumoniae; fusion gene; Streptococcus preumoniae; fusion gene;
others listed) or susceptibility to these disorders. The method

purposes, microbiocatalysts and diagnostic tools. Also for vaccination purposes, to elicit immunity for pathogens, like malaria and Streptococcus pneumoniae. In an example of the invention, acid pretreatment of farm-positive bacteria to enhance binding of AcmA protein anchor fusion is investigated by the construction of a reporter plasmid encoding a fusion gene of the L. lactis AcmD protein and the Streptococcus pneumoniae protease maturation protein PpmA. This sequence

pharmaceutical composition comprising a vaccine useful for mucosal immunization and for preparing a biocatalyst. The preparation is also useful for generating bioadsorbents or biofilters for environmental

material of gram-positive bacterium, e.g. for the preparation of

represents a homologue of the Lactococcus lactis AcmA anchor protein. The

region can be used in the generation of the fusion protein of the

```
The present invention describes a vehicle (A) for delivering a substance (I) to a predetermined site, which comprises (I); a system for inducing availability of at least one compartment of (A) towards the exterior; and, as targeting system for directing (A) to the site, an AcmA-type anchor protein (II). (A) are used for delivery of diagnostic and therapeutic agents to predetermined sites in the body, particularly joints or solid tumours but can be used more generally for health, medical, agricultural and cosmetic applications. (A) significantly
                                                                                                                                                     delivery; targeting system; AcmA-type anchor protein; solid tumour; health; medical; agricultural; cosmetic; controlled release.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vehicle for targeted delivery of therapeutic or diagnostic agents, includes protein anchor and system for inducing availability of the

The invention relates to a method of obtaining cell-wall material of a Gram-positive bacterium with improved capacity for binding to a proteinaceous substance (PS), or binding PS to cell-wall material of the bacterium, by treating the cell-wall material with a solution capable of removing a cell-wall component such as a protein, (lipo)esichoic acid or carbohydrate from the material. The method especially uses the binding of the PS with an anchor protein from the cell wall of the organism. The anchor protein is preferably the Lactococcus lactis AcmA call wall binding domain or its homolog or functional derivative. The method is useful for improving binding of proteinaceous substance to cell wall

Improving binding of a proteinaceous substance e.g. an AcmA-type protein to a cell-wall material of microorganisms, comprises treating the material with a solution capable of removing protein or carbohydrate from

The peptides were used to raise antibodies. The CD200 receptor is present in isoforms CD200R2a, CD2002b and CD2003a. The CD200R2b, and CD200R3a proteins, nucleic acids, or antibodies against the proteins are useful for manufacturing a medicament to modulate an immune response involved in
increases the half-life of peptides in the circulation and, by providing controlled release, ensures relatively high bioavailability, allowing therapeutic use of agents that would otherwise be too toxic for systemic administration. The native AcmA peptide targets Gram-positive bacteria but its homologues can be engineered to have different selectivity. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Mouse; cluster of differentiation 200 receptor; CD200 receptor; isoform; CD200R2a; CD2002b; CD2003a; immune response; graft rejection; diabetes; foetal loss; autoimmunity; allergy; inflammatory condition; cancer; skin condition; transplant rejection; autoimmune disease; arthritis; immune suppression; infection.

The invention relates to a method of detecting (MI) cancer in a patient by: (i) contacting a biological sample from the patient with an agent that binds to any of three polypeptides given in the specification; (ii) detecting in a sample an amount of the peptide that binds to the binding agent; and (iii) comparing the amount of polypeptide present in the patient's sample to a predetermined cutoff value. The specification also discloses a separate method for detecting (M2) cancer in a patient by a method similar to MI, except that the detection agent is an oligonucleotide that binds to any of three polynucleotides given in the specification. MI and M2 are useful for detecting the presence of cancer in a patient, especially chronic lymphocytic leukemia. The applicants in a patient, especially chronic lymphocytic leukemia. The applicants thave identified specific human polypeptides overexpressed in one or more types of hematological malignancies. This sequence corresponds to a peptide used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to a method of detecting (M1) cancer in a patient by: (1) contacting a biological sample from the patient with an agent that binds to any of three polypeptides given in the specification, (ii) detecting in a sample an amount of the peptide that binds to the binding agent, and (iii) comparing the amount of polypeptide present in the patient's sample to a predetermined cutoff value. The specification also discloses a separate method for detecting (M2) cancer in a patient by a method similar to M1, except that the detection agent is an enthod similar to M1 and M2 are useful for detecting the presence of cancer in a patient, especially chronic lymphocytic leukemia. The applicants in a patient, especially chronic lymphocytic leukemia. The applicants that the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting cancer in a patient comprises contacting a biological sample from the patient with a binding agent that binds to a cancer-associated polypeptide and comparing the amount of polypeptide to a predetermined
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

Sequences AAU21852-AAU22466 represent the cardiovascular system antigen

polypeptides of the invention. Cardiovascular system antigens and their

sesociated polymucleotides are useful in the diagnosis, treatment and

prevention of various types of disorders in e.g. humans, mice, rabbits,

prevention of various types of disorders in e.g. humans, mice, rabbits,

can be determined by detecting the presence or absence of a mutation in a

cardiovascular system antigen polymucleotide. The treatable disorders

include autoimmune diseases such as recomplasms of the breast or liver,

cardiovascular disorders such as recoplasms of the breast or liver,

cardiovascular disorders such as cardiac artest, cerebrovascular

cardiovascular disorders such as cardiac antest, cerebrovascular

cardiovascular disorders such as corneal infection, endocrine disorders such as

cular disorders such as corneal infection, endocrine disorders such as

crohn's disease, renal disorders such as glomerulonephitits and

respiratory disorders such as sethma and pleurisy. The polypeptides can

also be used to aid wound healing, to prevent skin aging due to sunburn,

contain organs before transplantation, to regenerate tissues and in

chemotaxis. Note: The sequence data for this patent did not form part of

the printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human cardiovascular system related polypeptides and the polymucleotides encoding them. The polypeptides, polymucleotides and antibodies to the polypeptides are useful for diagnoshing pathological condition or a susceptibility to a pathological condition, treating, or ameliorating a medical condition, such as cancer of cardiovascular system tissues, proliferative disorders, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disease, Parkinson's disease), captive disorders, schizophrenia, asthma, servindison's disease, parkinson's disease, promitive disorders, schizophrenia, asthma, si, cardiovascular disorders, angiogenic disorders, kidney disorders (astrointestinal disorders, pregnancy-related disorders, endocrine disorders and infections. The nucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-range restriction mapping. The polypeptides and polymucleotides are also useful for chromosome identification, radiation hybrid mapping or long-range capabilities, fat content or other nutritional components. This sequence represents a human cardiovascular system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 autoimmune disease; rheumatoid arthritis; hyperproliferative disorder; breast neoplasms; liver neoplasm; cardiovascular disorder; carebral ischaemia; angiogenesis; nerebrovascular disorder; excebral ischaemia; angiogenesis; nervous system disorder; Alzheimer's disease; infection; coular disorder; corneal infection; wound healing; epithelial cell proliferation; whin adaing; sand transplantation; cell culture; tissue regeneration; chemotaxis; food additive; preservative; cardiovascular system associated antigen; nuclear factor kappaB; NFkappaB; promoter element; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New cardiovascular system related polynucleotides and polypeptides, useful for preventing, treating, or ameliorating a medical condition, such as cancer of cardiovascular tissues and cancer metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Indels 11; Gaps

tragment. Also included recombinant vectors, recombinant host cells, an isolated human cardiovascular system associated polypeptide (or antigens), or its fragment. Also included recombinant vectors, recombinant host cells, an isolated cisolated human cardiovascular system associated polypeptide (including its fragment, allelic variant, species homologue or epitope), an isolated antibody that binds specifically to a human cardiovascular system casociated polypeptide, diagnosing a pathological condition or susceptibility to a pathological condition or caused by the mutation in human cardiovascular system associated in human cardiovascular system cardiovascular system associated polypeptides, the gene corresponding to the human cardiovascular system associated polypeptides, the gene corresponding to the human cardiovascular system associated cDNA sequence and identifying an activity in a biological assay comprising expressing the human cardiovascular system associated cDNA in a cell, isolating the cardiovascular system associated cDNA in a cell, isolating the cardiovascular system associated cDNA in a cell, isolating the cardiovascular system associated cDNA in a cell, isolating the cardiovascular system associated cDNA in a cell, isolating the cardiovascular system associated cDNA in a cell, isolating the cardiovascular system associated nucleic acids and polypeptides are used to prevent, treat or ameliorate a medical condition (for example in chammans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep), for example autoimmune diseases such as rheumatoid arthitis, hyperproliferative disorders, for example neoplasms of the breast or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Soluble, CD14; glycophosphoinositol anchored membrane protein; infection, cell surface; neutrophil; lipopolysaccharide; bacterium; interleukin; tumour necrosis factor-alpha; growth; invasiveness; pathogenic; monocyte; dissemination; bloodstream; peritoneal cavity; bacteraemia; antagonist; gastrointestinal tract; septicaemia; appendicitis; gastroenteritis; inflammatory bowel disease; peritonitis.
                                                                                                                                 New cardiovascular system-related nucleic acid molecule, useful for diagnosing, preventing or treating diseases of the cardiovascular system, and in chromosome mapping, drug screening or in pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid molecule encoding

The present sequence represents a fragment of a soluble myeloid cell-
surface glycoprotein (soluble CD14, (sCD14)), comprising residues 143-168
of the human recombinant sCD14 sequence. sCD14 is potent
lippoplysaccharide blocker that improves insulin resistance in diabetic
patients and normalizes blood glucose levels. The present sCD14 peptide
is used for the manufacture of a medicament for treatment or prevention
of chronic inflammacory conditions and chinical disorders associated with
insulin resistance. These include type 2 diabetes mellitus, obesity,
metabolic syndrome, arteriosclerotic disease, arterial hypertension,
functional ovaric hyperandrogenism, dyslipidaemia, coagulation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of soluble myeloid cell-surface glycoprotein in the treatment or prevention of chronic inflammatory conditions and clinical disorders of insulin resistance e.g. type 2 diabetes and obesity.
This sequence represents a soluble recombinant human CD14 (rsCD14) peptide fragment that has a lipopolysaccharide (LPS) binding activity. The invention provides a method for the prevention and treatment of a condition mediated by the action of LPS or membrane-bound CD14 that comprises administering this soluble mammalian CD14 fragment having LPS brinding activity. The method is used for preventing or treating sepsis, Gram-negative bacteraemia, autoimmune diseases or tissue rejection, especially Gram-negative bacterial sepsis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 lipopolysaccharide blocker; insulin resistance; blood glucose level; chronic inflammatory disease; type 2 diabetes mellitus; obesity; metabolic syndrome; arteriosclerotic disease; arterial hypertension; functional ovaric hyperandrogenism; dyslipidaemia; coagulation alternation; hyperuricaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    myeloid cell-surface glycoprotein; CD14; soluble CD14; sCD14;

                                                                                                                                                                                                                              This peptide represents amino acids 143-168 of the soluble form of the 55 kD CD14 glycophosphoinositol (GPI) anchored membrane protein. The protein is expressed strongly on the surface of monocytes and weakly on the surface of retrongly on the surface of monocytes forchardes (LPS), especially of bacterial origin, and binding causes cells to become highly activated and release interleukin such a tumour necrosis factor-alpha. One side effect of interleukin release is that it promotes growth and invasiveness of pathogenic bacteria, allowing thair dissemination into the bloodstream and peritoneal cavity. The invention relates to methods for preventing or treating bacteraemia in a patient or preventing the translocation of bacteria from the gastrointestinal tract, by administering a CD14 ancagonist, preferably a dipeptide which binds LPS, LPS binding protein complex. The methods are especially useful for controlling severe local infections, preventing and treating bacteraemia and septicaemia e.g. for peritonitis, appendicitis, gastroenteritis, inflammatory bowel diseases, etc

```
The present sequence represents a bovine vascular smooth muscle growth factor (VSGP) peptide. VSGP polypeptides, antigenic portions of and antivasGP antibodies are useful as diagnostic agents for detecting disease related to abnormal blood vessel formation. VSGP polypeptides are also useful for healing wounds or for preventing formation of an abnormal blood vessel. Inhibiting activity of a recombinant human VSGP against vascular formation induced by basic fibroblast factor (BrGF) was shown by injection of VSGF and bFGF into rat cornea. After 3 days vascular formation was clearly inhibited. Anti-VSGF antibodies are also useful for detection of wound healing failure, intractable skin ulcers, diabetic retinopathy, psoriasis, rheumatoid arthritis, angiomatosis, and arteriosclerosis or solid tumours

The present invention relates to a new protein with scaffold structure of C-type lectin-like domains (CTLD). The invention comprises a variant of a model CTLD where alpha-helices and beta-strands and connecting segments are conserved such that scaffold structure of C-type lectin-like domains are conserved such that scaffold structure of C-type lectin-like domains of CTLD) is substantially maintained, while the 14loop region is altered by control or their combination. The invention is useful for preparing a library of nucleotide sequences candon related proteins by randomising part or all of the nucleic acid sequence encoding the loop region of its CTLD. The artificial CTLD protein products are preferable to antibody derivatives as each binding site is a single structurally autonomous protein domain. When used as components of compositions to be used for in vivo diagnostic or therapeutic purposes, artificial CTLD protein products constructed on the basis of human CTLDs are virtually identical to the corresponding natural CTLD protein already present in the body and are therefore less provide tissue penetration and distribution, as well as shorter half life in circulation. Since murine and human tetranectin are identical in circulatives may be achieved. The present amino acid sequence represents a computer protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .;

                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel composition comprising a biologically active agent and mucosal delivery-enhancing effective amount of permeabilising peptide that reversibly enhances mucosal epithelial paracellular transport by modulating epithelial junctional etructure and/or physiology in a mammal. The agent of the invention inhibits homotyphic binding of epithelial membrane adhesive protein chosen junctional adhesion molecule (JAM), occludin and claudin. The biologically active agent is effective for treatment of sexual dysfunction or female sexual dysfunction. The present sequence is that of a permeabilising peptide of human JAM-1 which may be used during the production of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

Composition comprising biologically active agent and permeabilizing peptide that reversibly enhances mucosal epithelial paracellular transport by modulating epithelial junctional structure and/or physiology
occludin; claudin; sexual dysfunction; male erectile sexual dysfunction; female sexual dysfunction; human.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel composition comprising a biologically active agent and mucosal delivery-enhancing effective amount of permeabilising peptide that reversibly enhances mucosal epithelial paracellular transport by modulating epithelial junctional structure and/or physiology in a mammal. The agent of the invention inhibits junctional adhesion molecule (JAM), occludin and claudin. The biologically active agent is effective for treatment of sexual biologically active agent is effective for treatment of sexual escual dysfunction. The present sectuals escual dysfunction or female sexual dysfunction. The present sequence is that of a permeabilising peptide of human JAM-1 which may be used during the production of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   anorectic; cytostatic; eating disorder; neuroprotective; nootropic; cachexia; intranasal composition; peptide YY; obesity; cancer; maintrition; wasting; Alzheimer; disease; colon adenocarcinoma; panoreatic adenocarcinoma; breast carcinoma; cachexia; cancer cachexia; junctional adhesion molecule 1; JAM-1; epithelial junction; human.

The invention describes an intranasal composition comprising peptide YY compound(s) formulated for mucosal delivery to a mammalian subject. Also described is a ktt for treatment of a mammalian subject comprising the intranasal composition of peptide compound(s). The composition is used for treating obesity, cancer, or malnutrition or wasting related to cancer in the subject. It is used to alleviate Alzheimer's disease, colon adenocarcinoma, pancreatic adenocarcinoma, breast carcinoma, treatment and prevention of malnutrition resulting from iatrogenic causes or cachexia associated with advanced disease, or cancer cachexia in the subject. The composition alleviates the symptoms without unacceptable adverse side effects. This is the amino acid sequence of a human junctional adhesion molecule 1 (JAM-1) that may be used in a composition of the invention to modulate epithelial junction structure and/or
Intranasal compositions for treating obesity, cancer, or malnutrition on wasting related to cancer, comprises peptide compound(s) formulated for mucosal delivery to mammalian subject.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes an intranasal composition comprising peptide YY compound (9) formulated for mucosal delivery to a mammalian subject. Also described is a kit for treatment of a mammalian subject comprising the intranasal composition of peptide compound(s). The composition is used for treating obseity, cancer, or malnutrition or wasting related to cancer in the subject. It is used to alleviate Alzheimer's disease, colon adenocarcinoma, pancreatic adenocarcinoma, breast carcinoma, treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and prevention of malnutrition resulting from latrogenic causes or cachexia associated with advanced disease, or cancer cachexia in the subject. The composition alleviates the symptoms without unacceptable adverse side effects. This is the amino acid sequence of a human junctional adhesion molecule 1 (JAM-1) that may be used in a composition of the invention to modulate epithelial junction structure and/or

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
